General Solution to a Linear System Eigenvalues and Eigenvectors

 $\begin{array}{ll} \text{If } \boldsymbol{b} \in \mathcal{C}(\mathbf{A}) \text{:} & \boldsymbol{x}_g = \boldsymbol{x}_p + \boldsymbol{x}_n \text{ where} \\ \boldsymbol{x}_p \in \mathbb{R}^n \text{ and } \boldsymbol{x}_n \in \mathcal{N}(\mathbf{A}). \end{array}$

Minimum Norm Solution

 $\boldsymbol{x}_r \in \mathcal{C}\left(\mathbf{A}^{\top}\right) \text{ where } \boldsymbol{x}_r = \operatorname{proj}_{\mathcal{C}\left(\mathbf{A}^{\top}\right)}\left(\boldsymbol{x}_q\right).$

Least Squares (LS)

If $\boldsymbol{b} \notin C(\mathbf{A})$: $\boldsymbol{x} = \arg\min_{\boldsymbol{x}^* \in \mathbb{R}^n} \|\boldsymbol{b} - \mathbf{A} \boldsymbol{x}^*\|$. $b - Ax \in \mathcal{N}(A) \implies A^{\top}(b - Ax) = 0.$ $\mathbf{A}^{\top} \mathbf{A} \mathbf{x} = \mathbf{A}^{\top} \mathbf{b}$ (Normal Equations)

Orthogonal Projection

$$\mathbf{P} = \mathbf{A} \left(\mathbf{A}^{ op} \mathbf{A} \right)^{-1} \mathbf{A}^{ op}$$

 $\mathbf{P} oldsymbol{b} = \operatorname{proj}_{\mathcal{C}(\mathbf{A})} \left(oldsymbol{b}
ight) = \mathbf{A} oldsymbol{x}$

 \mathbf{P} is idempotent $(\mathbf{P}^2 = \mathbf{P})$ and $\mathbf{P}^{\top} = \mathbf{P}$.

Dependent Columns

If $nullity(\mathbf{A}) > 0$, NE yields infinitely many solutions as $\mathcal{N}(\mathbf{A}) = \mathcal{N}(\mathbf{A}^{\top}\mathbf{A})$.

Orthogonal Complement Projections

Given
$$\mathbf{P} = \operatorname{proj}_V$$
: $\mathbf{Q} = \operatorname{proj}_{V^{\perp}} = \mathbf{I} - \mathbf{P}$
 $\boldsymbol{b} = \operatorname{proj}_V(\boldsymbol{b}) + \operatorname{proj}_{V^{\perp}}(\boldsymbol{b}) = \mathbf{P}\boldsymbol{b} + \mathbf{Q}\boldsymbol{b}$
 $(\mathbf{P}\boldsymbol{b})^{\top} \mathbf{Q}\boldsymbol{b} = 0$
 $\mathbf{P}\mathbf{Q} = \mathbf{0}$ (zero matrix)

Change of Basis

Given the basis
$$W = \{ \boldsymbol{w}_1, \, \dots, \, \boldsymbol{w}_n \}$$

$$\boldsymbol{b} = c_1 \boldsymbol{w}_1 + \dots + c_n \boldsymbol{w}_n$$

$$b = \mathbf{W} c \iff (b)_W = c.$$

Orthonormal Basis

Normalised and orthogonal basis vectors. For $Q = \{q_1, ..., q_n\}, q_i^{\top} q_j = \delta_{ij}$, where

$$\delta_{ij} = \begin{cases} 1, & i = j \\ 0, & i \neq j \end{cases}$$

$$\mathbf{Q}\boldsymbol{c} = \boldsymbol{b} \iff \mathbf{Q}^{\top}\boldsymbol{b} = \boldsymbol{c} = (\boldsymbol{b})_{O}$$

Orthogonal Matrices

$$\mathbf{Q}^\top = \mathbf{Q}^{-1} \iff \mathbf{Q}^\top \mathbf{Q} = \mathbf{Q} \mathbf{Q}^\top = \mathbf{I}.$$

Projection onto a Vector

$$\begin{aligned} \operatorname{proj}_{\boldsymbol{a}}\left(\boldsymbol{b}\right) &= \boldsymbol{a} \left(\boldsymbol{a}^{\top} \boldsymbol{a}\right)^{-1} \boldsymbol{a}^{\top} \boldsymbol{b} \\ &= \frac{\boldsymbol{a}}{\|\boldsymbol{a}\|^{2}} \boldsymbol{a} \cdot \boldsymbol{b} \end{aligned}$$

Using a unit vector \boldsymbol{q} :

$$\operatorname{proj}_{\boldsymbol{q}}\left(\boldsymbol{b}\right) = \boldsymbol{q}\left(\boldsymbol{q}\cdot\boldsymbol{b}\right)$$

Gram-Schmidt Process

Converts the basis W that spans $\mathcal{C}(\mathbf{A})$ Eigenvalues are always purely imaginary. to an orthonormal basis Q.

$$\begin{aligned} & \boldsymbol{v}_1 = \boldsymbol{w}_1 & & \boldsymbol{q}_1 = \hat{\boldsymbol{v}}_1 \\ & \boldsymbol{v}_2 = \boldsymbol{w}_2 - \boldsymbol{q}_1 \left(\boldsymbol{q}_1 \cdot \boldsymbol{w}_2 \right) & & \boldsymbol{q}_2 = \hat{\boldsymbol{v}}_2 \\ & \vdots & & \vdots & & \vdots \end{aligned}$$

$$oldsymbol{v}_i = oldsymbol{w}_i - \sum_{i=1}^{i-1} oldsymbol{q}_j \left(oldsymbol{q}_j \cdot oldsymbol{w}_i
ight) \quad oldsymbol{q}_i = \hat{oldsymbol{v}}_i$$

V and Q span W, and V is orthogonal.

QR Decomposition

$$A = QR$$

where \mathbf{Q} is orthogonal and \mathbf{R} is upper triangular. $\mathbf{R} \mathbf{x} = \mathbf{Q}^{\mathsf{T}} \mathbf{b}$ solves LS.

$$\mathbf{A}\mathbf{v} = \lambda\mathbf{v} \iff (\lambda\mathbf{I} - \mathbf{A})\,\mathbf{v} = \mathbf{0}: \mathbf{v} \neq \mathbf{0}$$

Characteristic Polynomial

$$P\left(\lambda\right) = \det\left(\lambda \mathbf{I} - \mathbf{A}\right) = 0.$$

Eigen Decomposition

$$\begin{aligned} \mathbf{A}\mathbf{V} &= \mathbf{V}\mathbf{D} \iff \mathbf{A} &= \mathbf{V}\mathbf{D}\mathbf{V}^{-1} \\ \mathbf{V} &= \begin{bmatrix} v_1 & \cdots & v_n \end{bmatrix} \\ \mathbf{D} &= \mathrm{diag}\left(\lambda_1, \, \ldots, \, \lambda_n\right). \end{aligned}$$

Algebraic Multiplicity $\mu(\lambda_i)$

Multiplicity of λ_i in $P(\lambda)$, for $d \leq n$ distinct eigenvalues,

$$P\left(\lambda\right) = \left(\lambda - \lambda_1\right)^{\mu(\lambda_1)} \cdots \left(\lambda - \lambda_d\right)^{\mu(\lambda_d)}.$$
 In general

$$1 \le \mu\left(\lambda_i\right) \le n$$

$$\sum_{i=1}^{d} \mu\left(\lambda_i\right) = n$$

If nullity $(\mathbf{A}) > 0$

$$\exists k : \lambda_k = 0 : \mu(\lambda_k) = \text{nullity}(\mathbf{A})$$

Geometric Multiplicity $\gamma(\lambda_i)$

Dimension of the eigenspace associated Consider the inverse mapping $u_i\mapsto \frac{1}{\sigma_i}v_i$ with λ_i .

$$\gamma \left(\lambda _{i}\right) =\mathrm{nullity}\left(\lambda _{i}\mathbf{I}-\mathbf{A}\right) .$$

Given $d \leq n$ distinct eigenvalues,

$$1 \le \gamma\left(\lambda_i\right) \le \mu\left(\lambda_i\right) \le n$$

$$d \le \sum_{i=1}^{d} \gamma\left(\lambda_{i}\right) \le n.$$

Eigenvectors corresponding to distinct eigenvalues are linearly dependent.

Defective Matrix

A lacks a complete eigenbasis:

$$\exists k : \gamma(\lambda_k) < \mu(\lambda_k)$$

Matrix Similarity

 \mathbf{A} and \mathbf{B} are similar if

$$\mathbf{B} = \mathbf{P}^{-1}\mathbf{A}\mathbf{P}.$$

They share $P(\lambda)$, ranks, determinants, traces, and eigenvalues (also μ and γ).

Symmetric Matrices $\mathbf{S}^{\top} = \mathbf{S}$

S is always diagonalisable and has V is a vector space with vectors $\boldsymbol{v} \in V$ eigenvectors: $\mathbf{S} = \mathbf{Q}\mathbf{D}\mathbf{Q}^{\mathsf{T}}$.

Skew-Symmetric Matrices $\mathbf{K}^{\top} = -\mathbf{K}$

Positive-Definite Matrices

 \mathbf{M} is (symmetric) positive definite if all ulletits eigenvalues are positive. Also

$$\boldsymbol{x}^{\top} \mathbf{M} \boldsymbol{x} > 0 : \forall \boldsymbol{x} \in \mathbb{R}^n \setminus \{ \boldsymbol{0} \}$$

Matrix Functions

Given a nondefective matrix:

$$\begin{split} f\left(\mathbf{A}\right) &= \mathbf{V} f\left(\mathbf{D}\right) \mathbf{V}^{-1} & \text{For the scalar multi} \\ &= \mathbf{V} \operatorname{diag}\left(f\left(\lambda_{1}\right), \, \ldots, \, f\left(\lambda_{n}\right)\right) \mathbf{V}^{-1}. & \text{Closure: } k\boldsymbol{u} \in V \\ \text{for an analytic function } f. & \text{Distributivity: } k \end{split}$$

Cayley-Hamilton Theorem

$$\forall \mathbf{A} : P(\mathbf{A}) = \mathbf{0}$$
 (zero matrix)

Singular Value Decomposition

$$\mathbf{A}\mathbf{V} = \mathbf{U}\mathbf{\Sigma} \iff \mathbf{A} = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^{\top}$$

 $\mathbf{V}^{\top} = \mathbf{V}^{-1}. \quad \mathbf{U}^{\top} = \mathbf{U}^{-1}$

 $\Sigma = \operatorname{diag}(\sigma_1, \ldots, \sigma_r, 0, \ldots, 0).$ Left singular vectors \boldsymbol{u} : $\mathbf{U} \in \mathbb{R}^{m \times m}$

$$\mathcal{C}\left(\mathbf{A}\right)=\operatorname{span}\left(\left\{\boldsymbol{u}_{i\leq r}\right\}\right)$$

$$\mathcal{N}\left(\mathbf{A}^{ op}
ight) = \mathrm{span}\left(\left\{oldsymbol{u}_{r < i \leq m}
ight\}
ight)$$

$$\begin{split} \mathcal{N}\left(\mathbf{A}^{\top}\right) &= \operatorname{span}\left(\left\{\boldsymbol{u}_{r < i \leq m}\right\}\right) \\ \text{Right singular vectors } \boldsymbol{v} \colon \mathbf{V} \in \mathbb{R}^{n \times n} \end{split}$$

$$\mathcal{C}\left(\mathbf{A}^{ op}
ight) = \mathrm{span}\left(\left\{oldsymbol{v}_{i < r}
ight\}
ight)$$

$$\begin{split} \mathcal{N}\left(\mathbf{A}\right) &= \operatorname{span}\left(\left\{\boldsymbol{v}_{r < i \leq n}^{-}\right\}\right) \\ \text{Singular values } \sigma_{i} \text{: } \boldsymbol{\Sigma} \in \mathbb{R}^{m \times n} \end{split}$$

The eigenvalues of $\mathbf{A}^{\top}\mathbf{A}$ and $\mathbf{A}\mathbf{A}^{\top}$ are equal, $\mathbf{\Sigma}^{\top}\mathbf{\Sigma}$ and $\mathbf{\Sigma}\mathbf{\Sigma}^{\top}$ have the same diagonal entries, and when m = n, $\widecheck{\boldsymbol{\Sigma}}^{\top}\widecheck{\boldsymbol{\Sigma}}=\widecheck{\boldsymbol{\Sigma}}\widecheck{\boldsymbol{\Sigma}}^{\top}=\widecheck{\boldsymbol{\Sigma}}^{2}.$ To find σ_{i} compute:

$$\mathbf{A}^{\top}\mathbf{A} = \mathbf{V}\mathbf{\Sigma}^{\top}\mathbf{\Sigma}\mathbf{V}^{\top}$$

$$\mathbf{A}\mathbf{A}^{\top} = \mathbf{U}\mathbf{\Sigma}\mathbf{\Sigma}^{\top}\mathbf{U}^{\top}$$

so that $\sigma_i = \sqrt{\lambda_i}$ where $\sigma_1 \ge \cdots \ge \sigma_r > 0$.

Reduced SVD

Ignores m-n "0" rows in Σ so that $\mathbf{U} \in \mathbb{R}^{m \times n}$ and $\mathbf{\Sigma} \in \mathbb{R}^{n \times n}$.

Pseudoinverse

$$\mathbf{A}^{\dagger}\boldsymbol{u}_{i} = \frac{1}{\sigma_{i}}\boldsymbol{v}_{i} \iff \mathbf{A}^{\dagger}\boldsymbol{u}_{i} = \frac{1}{\sigma_{i}}\boldsymbol{v}_{i}\boldsymbol{u}_{i}^{\top}\boldsymbol{u}_{i}$$

$$\mathbf{A}^\dagger = \sum_{i=1}^r \frac{1}{\sigma_i} \boldsymbol{v}_i \boldsymbol{u}_i^\top \iff \mathbf{A}^\dagger = \mathbf{V} \mathbf{\Sigma}^\dagger \mathbf{U}^\top$$

where $\Sigma^{\dagger} = \operatorname{diag}(\sigma_1, \ldots, \sigma_r, 0, \ldots, 0).$ $x = \mathbf{A}^{\dagger} \mathbf{b}$ solves LS.

Truncated SVD

Express **A** as the sum of rank-1 matrices:

$$\mathbf{A} = \sum_{i=1}^n \sigma_i oldsymbol{u}_i oldsymbol{v}_i^ op$$

$$\mathbf{A} = \sum_{i=1}^r \sigma_i \boldsymbol{u}_i \boldsymbol{v}_i^\top \qquad (\sigma_{r < i \leq n} = 0)$$

Rank- ν approximation of **A**:

$$\mathbf{A}pprox ilde{\mathbf{A}} = \sum_{i=1}^{
u} \sigma_i oldsymbol{u}_i oldsymbol{v}_i^{ op}.$$

General Vector Spaces

real eigenvalues with real orthogonal if the following 10 axioms are satisfied for $\forall \boldsymbol{u}, \boldsymbol{v}, \boldsymbol{w} \in V$ and $\forall k, m \in \mathbb{R}$, given an addition and scalar multiplication operation.

For the addition operation:

- Closure: $u + v \in V$
- Commutativity: $\boldsymbol{u} + \boldsymbol{v} = \boldsymbol{v} + \boldsymbol{u} \in V$
- Associativity:

$$u + (v + w) = (u + v) + w$$

- Identity: $\exists 0 \in V : u + 0 = 0 + u = u$
- Inverse: $\exists (-u) \in V : u + (-u) = 0$

For the scalar multiplication operation:

- Distributivity: $k(\mathbf{u} + \mathbf{v}) = k\mathbf{u} + k\mathbf{v}$
- Distributivity: $(k+m) \mathbf{u} = k\mathbf{u} + m\mathbf{u}$
- Associativity: $k(m\mathbf{u}) = (km)\mathbf{u}$
- Identity: $\exists 1 \in \mathbb{R} : 1u = u$

Examples of Vector Spaces

The set of $m \times n$ matrices $\mathcal{M}_{mn} T: V \to W$ satisfying with matrix addition and scalar $T(k\mathbf{u}) = kT$ multiplication.

The set of functions $\mathcal{F}(\Omega): \Omega \to \mathbb{R}$ with addition and scalar multiplication defined pointwise.

Subspaces

The subset $W \subset V$ is itself a vector space if it is closed under addition and scalar multiplication.

Examples of Subspaces

Subspaces of \mathbb{R}^n :

• Lines, planes and higher-dimensional analogues in \mathbb{R}^n passing through the origin.

Subspaces of \mathcal{M}_{nn} :

- The set of all symmetric $n \times n$ matrices, denoted $\mathcal{S}_n \subset \mathcal{M}_{nn}$.
- The set of all skew symmetric $n \times n$ matrices, denoted $\mathcal{H}_n \subset \mathcal{M}_{nn}$.

Subspaces of \mathcal{F} :

- The set of all *polynomials* of degree n or less, denoted $\mathscr{P}_n\left(\Omega\right)\subset\mathscr{F}\left(\Omega\right)$.
- The set of all continuous functions, denoted $C(\Omega) \subset \mathcal{F}(\Omega)$.
- The set of all functions with continuous nth derivatives, denoted $C^{n}(\Omega) \subset C(\Omega)$.
- The set of all functions f defined on [0,1] satisfying f(0) = f(1).

General Vector Space Terminology

Let $S = \{ \boldsymbol{v}_1, \ldots, \boldsymbol{v}_k \}$ and $c_1, \ldots, c_k \in \mathbb{R}$:

- The linear combination of S is a vector of the form $\mathbf{v} = c_1 \mathbf{v}_1 + \dots + c_k \mathbf{v}_k$.
- S is linearly independent iff $c_1 v_1 + \cdots + c_k v_k = \mathbf{0}$ has the trivial solution.
- span (S) is the set of all linear combinations of S.

S is a basis for a vector space V if

- \bullet S is linearly independent.
- $\operatorname{span}(S) = V$.

The number of basis vectors denotes the dimension of V.

Not all vector spaces have a basis. Function spaces such as C are infinite dimensional.

Examples of Standard Bases

• \mathcal{M}_{22} : $\left\{ \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix} \right\}$ • \mathcal{S}_{22} : $\left\{ \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix} \right\}$ • \mathcal{H}_{22} : $\left\{ \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix} \right\}$ • \mathcal{H}_{22} : $\left\{ \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix} \right\}$

Linear Transformations

$$T o W$$
 satisfying
$$T(k\mathbf{u}) = kT(\mathbf{u})$$

$$T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$$
